

Datasheet, Version 2/2016

Catalog #	1536
Synonyms	Endolysin Φ812
Type	Recombinant
Source	E. coli
Species	Bacteriofhage Φ812
Tag	His6
Form	Liquid
Purity	>96% by SDS-PAGE

# Shipping Ice pack

#### Introduction

Endolysins are hydrolytic enzymes produced by bacteriophages in order to cleave the host's cell wall during the final stage of the lytic cycle. They are highly evolved enzymes able to cleave peptidoglycan (murein), the main component of bacterial cell wall, which allows the release of progeny virions from the lysed cell. They are highly species specific, leaving non-target bacteria intact.

#### Description

Recombinant F1 fragment of phage  $\Phi 812$ 

### Application

Anti-Staphylococcus aureus activities, Turbidity-reduction assay, plaque assay, various anti-pathogen studies

#### **Purification method**

Affinity chromatography

#### Formulation

 $50 \mathrm{mM}$  Tris pH 7,5; 150 mM NaCl, 1 mM EDTA; 5 mM DTT, 50% glycerol, may contain traces of imidazol

#### Specificity

Specifically cleave peptidoglycan in Staphylococcus aureus cell wall leading to cell lysis.

### Storage

-80C

# Analyte specific reagent (ASR) manufactured under ISO 13485. Country of origin: Czech Republic
